

Creating a database with a listing of all items with duplicate items being listed only one time.

IDEA's *Duplicate Key Detection* allows you to either create an output file of the duplicate items or a file without any of the duplicate items.

Occasionally you need a file with a listing of all items with the duplicate items being listed only one time.

Accomplish using Summarization

- Select your fields that constitute a duplicate item as your *Fields to summarize*
- DO NOT select any *Numeric fields to total*
- Select the additional fields in your database to add to the summarized file
- This will produce a new database with one listing per duplicate record.
